

Damped piezoresistive accelerometer Model 726C

Frequency response calibration of 726C

Key features

- DC response and wide bandwidth
- Multi-mode damping
- Mechanical stops
- In-dummy application
- SAE J211/J2570 compliant

Model 726C is a very low mass accelerometer weighing only 1.4 grams. This accelerometer is designed for automotive safety testing applications that require, broad frequency response, and minimum zero shift following the event.

Model 726C utilizes a unique and advanced micro-machined piezoresistive sensor, which includes multi-mode damping for exceptional bandwidth with no significant resonance response in the usable range. This monolithic sensor incorporates the latest MEMS technology for ruggedness, stability and reliability over previous designs. The accelerometer has a two active arm, full bridge circuit with fixed completion resistors to facilitate shunt calibration. With a frequency response extending down to dc (steady state acceleration), this accelerometer is ideal for measuring long duration transient shocks.

726C has a full scale range of 2000 g and gas damping. It is available with less than 1% transverse sensitivity and less than ± 25 mV Zero Measurand Output as the "TZ" option. 726C comes standard with calibration data for 2V, 5V and 10V excitation.

US patent 6,988,412 applies.
